TI Twin-chamber syringe filled with a charge of activity-sensitive human protein

AB A twin-chamber syringe has a pyrogen-free sterile solvent in the chamber averted from the needle, and in the second chamber facing the needle a charge of activity-sensitive human protein, introduced and lyophilized in a single operation in the syringe, where it is stored, in a quantity necessary for therapeutically effective administration. The invention also relates to the filling of the syringe and the potential it offers for immediate use of activity-sensitive human proteins and for self-administration at home.

TI Plasma fraction purification using silica resin bound to a ligand
AB There is provided, in accordance with practice of this invention, a process for separating Factor IX and/or Factor X from an impure protein fraction containing protein in addition to Factors IX and X. A silica resin coupled with a ligand capable of binding Factor IX and/or Factor X is provided. An aqueous solution of the impure protein fraction is applied to the ligand-coupled silica resin to thereby bind the Factor IX and/or Factor X to the resin. The Factor IX and/or Factor X is then recovered from the resin by elution.

TI Dry powder compositions having improved dispersivity
AB The present invention provides a highly dispersible formulation comprising
an active agent and a dipeptide or tripeptide comprising at least two
leucyl residues. The composition of the invention possesses superior aerosol
properties and is thus preferred for aerosolized administration to the
lung. Also provided are a method for (i) increasing the dispersibility of
an active-agent containing formulation for administration to the lung, and
(ii) delivery of the composition to the lungs of a subject. The surface
tension of several representative di- and tripeptides and proteins was
determined and highly surface active peptides include dileucine and trileucine.
